

Shaurya Bhushan Bhavsar
Podar International School
IB Year 2

I'm interested in joining the Stanford Neuroscience Journal Club; as an International Baccalaureate (IB) Year 2 student with a strong interest in neuroscience and how it intersects with technology, I would like to deepen my understanding through the structured academic discussions of current research.

I am interested in neuroscience because of my fascination with neurotechnology and brain-computer interfaces for use in gaming and controlling devices. My interest lies in how neural signals can be converted to actions, and I hope to become a professional in this field. In an effort to gain a foundational understanding of neuroscience as a discipline, I have completed online courses on the topic of neuroscience (i.e., a Harvard course of neuroscience and university of Tasmania from Australia). I also have taken it upon myself to familiarize myself with the scientific literature by reading research papers independently.

Currently, I am conducting an experiment using EEG electrodes to measure neuroscience-related activity occurring in plants; this has allowed me to have a better understanding of how to design experimental projects and interpret data.

I have taken part in two Model United Nations conferences and was awarded a Silver Award; this experience reinforced my public speaking, analytical reasoning, and teamwork skills. The main reason I am so excited by this journal club is that it gives me a chance to work together with others on complex research and gain experience understanding how to evaluate scientific papers critically, express my thoughts clearly, and collaborate with others who have similar interests.

I am confident that my interest in and insight into neuroscience, my analytical nature, and my enthusiasm for neuroscience would allow me to participate fully and contribute positively to group discussions. I appreciate your consideration of my application and would be very grateful for the opportunity to continue increasing my knowledge and understanding of neuroscience through being a member of this group.

Best Regards,
Shaurya Bhushan Bhavsar
